Morass Royal Palm
Roystonea princeps

Height: 65 feet

Spread: 20 feet

Sunlight: 

Hardiness Zone: 10a

Other Names: Morass Cabbage Palm, Marsh Cabbage Palm

Description:

A magnificent palm with a tall column-like trunk topped with a superb green crownshaft, supporting attractive, arching, feather-like green leaves; a wonderful vertical accent tree in warm climate landscapes

Planting & Growing

Morass Royal Palm will grow to be about 65 feet tall at maturity, with a spread of 20 feet. It has a high canopy of foliage that sits well above the ground, and should not be planted underneath power lines. As it matures, the lower branches of this tree can be strategically removed to create a high enough canopy to support unobstructed human traffic underneath. It grows at a medium rate, and under ideal conditions can be expected to live to a ripe old age of 150 years or more; think of this as a heritage tropical plant for future generations!

This tropical plant should only be grown in full sunlight. It prefers to grow in moist to wet soil, and will even tolerate some standing water. This plant should not require much in the way of fertilizing once established, although it may appreciate a shot of general-purpose fertilizer from time to time early in the growing season. It is not particular as to soil pH, but grows best in rich soils, and is able to handle environmental salt. It is highly tolerant of urban pollution and will even thrive in inner city environments. This species is not originally from North America.
