

**Roble Beech**  
*Nothofagus obliqua*

Height: 50 feet  
Spread: 25 feet  
Sunlight: ○  
Hardiness Zone: 8a

**Description:**

An intriguing specimen with overlapping branches that give the tree a herringbone appearance; irregular and upright, this tree has a peculiar shape; green, wavy leaves turn yellow to red in the fall; select when fast growth is desired

**Ornamental Features**

The Roble Beech has attractive green deciduous foliage on a tree with a pyramidal habit of growth. The serrated oval leaves are highly ornamental but do not develop any appreciable fall colour.

**Landscape Attributes**

The Roble Beech is a deciduous tree with a distinctive and refined pyramidal form. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition.

This tree will require occasional maintenance and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Spreading

The Roble Beech is recommended for the following landscape applications;

### **Planting & Growing**

The Roble Beech will grow to be about 50 feet tall at maturity, with a spread of 25 feet. It has a high canopy with a typical clearance of 5 feet from the ground, and should not be planted underneath power lines. It grows at a fast rate, and under ideal conditions can be expected to live for 50 years or more.

This tree should only be grown in full sunlight. It is very adaptable to both dry and moist growing conditions, but will not tolerate any standing water. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This species is not originally from North America.
